1 Introduction

For over 50 years, VSL Australia Pty Ltd has been an industry leader in the design, supply and installation of superior post-tensioning products throughout Australasia and the Pacific Basin. The renowned VSL CT Stress Bar and its associated products have grown to meet Australia's expanding demand for high quality performance grade products.

The VSL CT Stress Bar system is comprised of high tensile heat treated bar. This system has particular attributes that make it more economical to use, compared to other forms of post-tensioning tendons of similar length. These attributes include:

- Bar tendons that are rigid and self-supporting and ideally suited to post-tensioning vertical elements.

- Threads and nuts that provide an anchorage that can be locked-off with minimal draw-in. This is particularly useful for short tendons.
- Coupling tendons that is simple and fast.

The VSL CT Stress Bar System is more economical compared with wire or strand systems when tendon lengths of less than 10 meters are being considered. This economical advantage is due to the system's relatively cost effective anchorage

VSL CT Stress Bar grade

Coarse Thread (CT) Stress Bars – Grade 1030 hot rolled and heat treated to comply with AS/NZS 4672 requirements of Elastic Modulus value $200\pm 10\text{GPa}$. Standard diameter ranges available from $\varnothing 26\text{mm}$ to $\varnothing 75\text{mm}$.

The VSL proprietary CT thread is rolled onto the bar at VSL's facility in Australia.

Quality control

VSL Australia is accredited under a quality assurance system in compliance with the quality standard AS/NZS ISO 9001: 2015. Bars and anchorages comply with the requirements of international standards related to prestressing tendons and anchorages. The bars and anchorage components are tested for acceptance using a batch sampling procedure.

In addition to this, VSL Australia's CT Bar is also an accredited 'Australian Made' product, thus positioning it as a recognised and leading producer of Local Content, in support of key Australian Infrastructure Projects.

VSL CT Stress Bar configurations

VSL BAR SYSTEM	THREAD DETAILS					Architectural Components Available	Maximum Bar Length* m
	Full Thread	End Thread	Right-Hand Thread	Left-Hand Thread	Cold Thread		
26-56 CT Bar	•	•	•	•	•	•	12m
75mm Bar	–	•	•	•	•	•	12m

*5.85m length is recommended for 20ft container transport

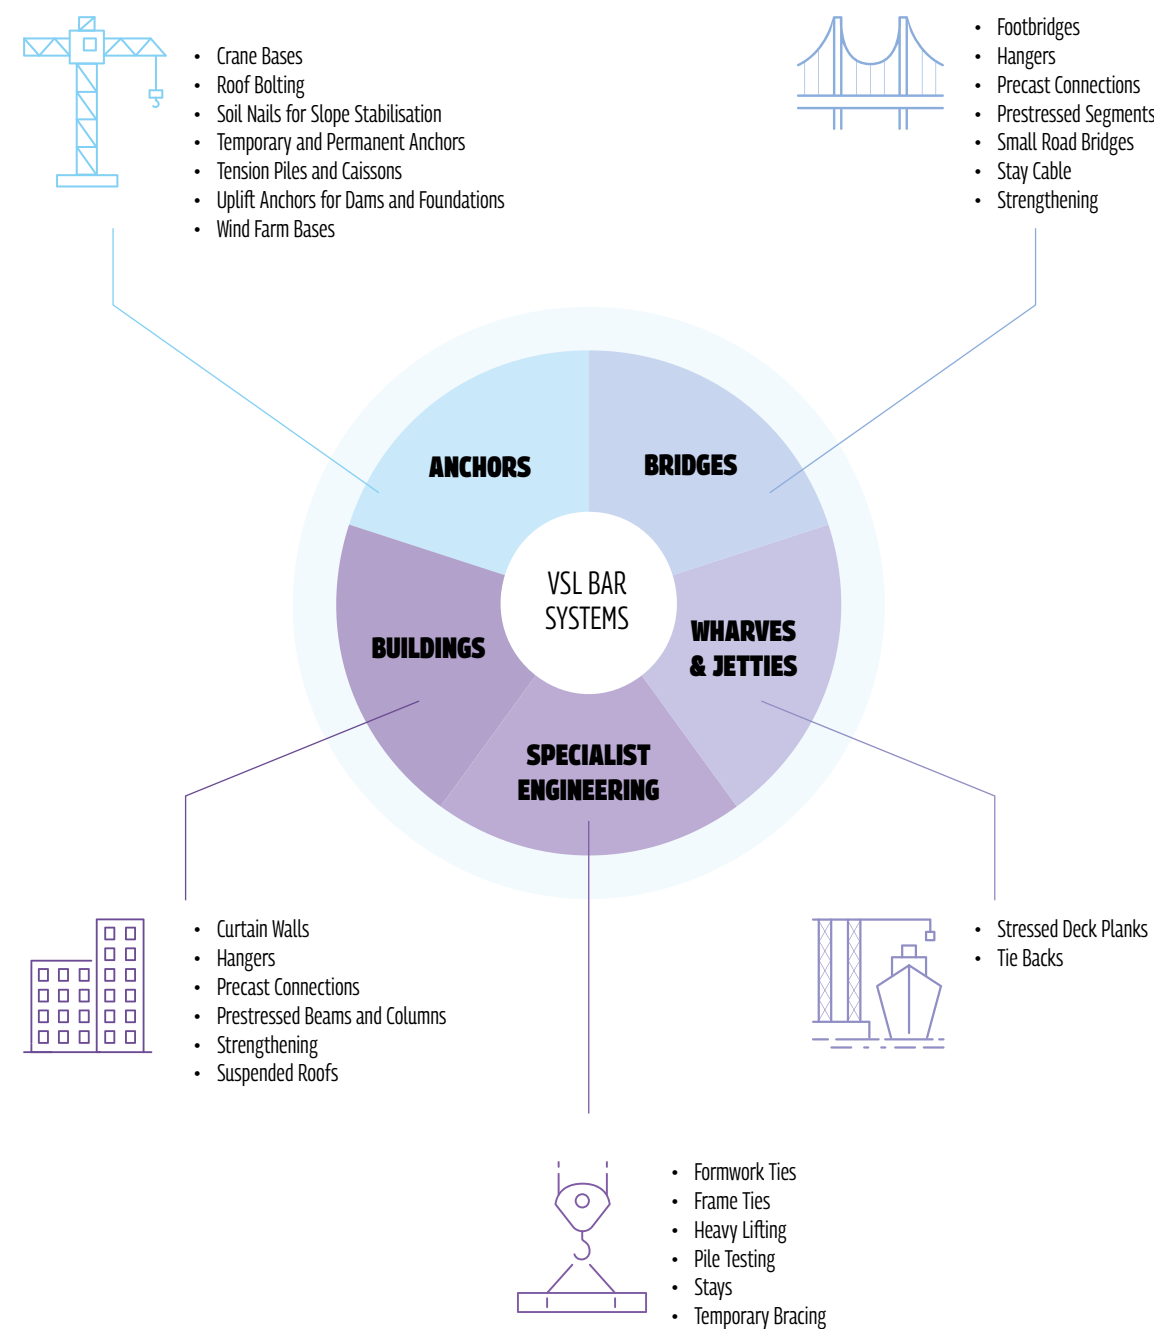

*11.85m length is recommended for 40ft container transport

75mm CT Bar is supplied with 1000mm threaded ends as standard. Please consult with your local VSL supply source for other threaded length requirements.

2 Applications

VSL CT Bar System is ideal for the economic application of post-tensioning forces on relatively short tendons. Bar systems operate through threaded connections and anchorages, making them simple and easy to use in both prestressed and non prestressed applications. VSL bar systems are intended for axial tensile load applications only – bars have limited capacity for shear and or combined actions. Please consult your local VSL office for further advice where CT Stressbar are subject to combined actions. The Designer may also need to consider fatigue and other related behaviors for suitability in the intended project.

Please contact your local VSL office to discuss your application requirements with a VSL CT Stress Bar specialist.

3 VSL CT Stress Bar – grade 1030

Steel properties

VSL CT Stress Bars are hot rolled from high strength grade 1030 alloyed steel and heat treated using world class technology to obtain an Elastic Modulus value of 200±10 GPa as per AS/NZS 4672, BS4486 and EN10138 specifications. The in-line single bar induction process ensures greater consistency in physical properties and stress-free straight bars.

Cold rolled threads

A coarse thread with 6mm pitch is cold rolled directly onto the bar. Bars can be supplied as follows:

- 1) CTS – 500mm End Threaded only (all sizes)
- 2) CTA – Fully Threaded (Please contact your local VSL supplier for 75mm)

Characteristics of VSL CT Stress Bar – grade 1030

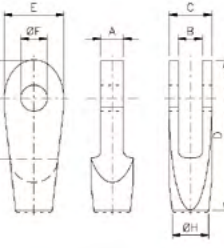

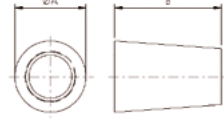

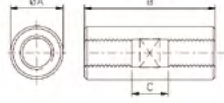

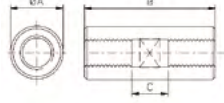

(mm)	(mm)	(mm²)	(kg/m)	(MPa)	Min Breaking Force (kN)	0.1% Proof Force (kN)	%	(GPa)	(mm)	Major Thread Diameter (mm)	Minor Thread Diameter (mm)
26	27	562	4.41	1,030	579	469	6	200 ± 10	6	28.2	25.2
29	30	693	5.44	1,030	714	579	6	200 ± 10	6	31.2	28.2
32	33	840	6.59	1,030	865	702	6	200 ± 10	6	34.4	31.0
36	36	995	7.81	1,030	1,025	831	6	200 ± 10	6	37.4	34.0
40	40	1232	9.67	1,030	1,269	1,029	6	200 ± 10	6	41.4	38.0
48	48	1780	13.97	1,030	1,833	1,486	6	200 ± 10	6	49.5	46.1
56	56	2428	19.06	1,030	2,501	2,028	6	200 ± 10	6	57.7	54.3
75	75	4371	34.31	1,030	4,502	3,651	6	200 ± 10	6	77.5	72.7

Notes:

- Characteristic strength values meet the code requirements of AS/NZS 4672.
- 48mm diameter bar properties are in accordance with VSL specifications and meet the intent of the Australian standard as this size is not listed in AS/NZS 4672.
- Other sizes (up to 90mm) are available as a special order. Please consult your local VSL office regarding availability.
- Relaxation properties, as per AS 4672 are 4% maximum at 1000hrs when loaded to 70% of minimum breaking load.
- Minimum bend radius = 200 x bar diameter.
- Allow minimum 1mm draw-in for anchorage of bars on the standard nut at lock off.

4 Corrosion protection

VSL CT Stress Bars and components must receive protection when installed under permanent conditions in an exposed environment. In standard concrete construction, the use of a galvanized duct injected with grout provides sufficient protection. Anchorage recesses must also be filled with cement mortar/epoxy to protect the ends. An alternative corrosion protection may be required for specific applications. VSL seek to provide the best forms of protection to meet usage and project specifications.

Coating specifications for a project will vary according to a large number of factors, both technical and economic. It is important to fully examine a potential coating to identify its durability performance before committing to a corrosion protection system. VSL recommend consultation with an experienced Corrosion Consultant during the design phase or when modifying any structural element. The following is a range of available systems that VSL has provided extensively since 1971.

VSL CT Stress Bar – grade 1030

THREE COAT PAINT SYSTEMS

EPOXY COATING – a three coat epoxy system that is used for non-visual applications such as wharf ties, portal frames, frame connectors, water tanks, sewerage treatment plants, structure strengthening, holding down bolts, rock anchors, soil nails etc.

POLYURETHANE COATING – a three coat system comprising a single coat of primer and two top coats of polyurethane which give superior performance in relation to colour retention and reduction in chalking when exposed to atmospheric conditions.

GREASED AND SHEATHED IN POLYETHYLENE

Vertical bars used in water storage structures, free length of soil and rock anchors, wharf ties, hangers, cable stays, silos, remedial strengthening and all unbonded tendons. Depending on the application and anchoring detail, the ends of the PE pipe may be sealed with a suitable heat shrink sleeve to prevent ingress of moisture and/or escape of grease.

INORGANIC ZINC (I0Z)

An Inorganic Zinc Base Coating that protects steel galvanically. Applied as a single coat, it provides protection for steel structures exposed to weather and acts as a base coat for organic and inorganic top coats in more aggressive environments. This type of coating is used widely in environments such as refineries and coastal areas including offshore structures.

THE DENSO PETROLATUM/PCS PETROGARD SYSTEM

A long life corrosion protection system; this multi-component system remains permanently plastic and flexible and offers excellent conformability and longevity. The system provides 100% uniform coverage and unrivalled corrosion protection in terms of surface preparation requirements and ease of application.

THERMAL DIFFUSION GALVANISING

This metallurgical vapour diffusion process is used to apply a uniform, sacrificial, zinc-iron coating to ferrous and certain non-ferrous materials. The corrosion-resistant and abrasion-resistant coating helps to increase durability in harsh environments. 85µm of thickness is recommended by the specialist applicator.

Fittings and accessories

VSL CT Stress Bar Components can be protected by one of the following methods.

- Hot Dip Galvanized to Min 40µm as per the Australian Standard AS/NZS 4680
- 3 Coat Paint Systems/Inorganic Zinc (I0Z)
- Mechanical Plating (Galvacoat) – 40µm coating of zinc equivalent to AS/NZS 4680 or AS/NZS 1214. The process avoids potential for hydrogen embrittlement.

NOTE: threads are re-tapped after the corrosion protection process to ensure thread is viable during assembly.

Corrosion Protection System	Indicative Years to First Maintenance – Expected Min to Max.					
	Atmospheric Corrosivity Categories					
	C1	C2	C3	C4	C5	Cx
	Very Low	Low	Medium	High	Very High	Extreme
Bonded PT Tendon (Cement Grout)	25+	25+	25+	25+	25+	25+
Wax/ grease with PE sheathing	25+	25+	25+	25+	25+	25+
Three Coat Paint system : Epoxy	25+	15-25+	10-25+	5-25+	2-25	Seek advice
Three Coat Paint system : Polyurethane	25+	10-25+	5-25+	2-25+	2-25	Seek advice
Inorganic Zinc	25+	25+	15-25	10-15	2-5	Seek advice
Petrolatum Impregnated tapes or similar	25+	25+	25+	10-25+	5-25+	5-25
Thermal Galvanised	25+	25+	25+	10-25+	5-25+	2-15
Hot Dip Galvanising (Components only)	25+	25+	25+	10-25+	5-25+	2-15

Notes:

- Atmospheric Corrosivity Categories are in accordance with AS 2312:2014.
- All information contained herein is indicative only and shall be used as a guide for initial suitability assessment. VSL recommend guidance is sought from a specialist durability consultant for Atmospheric Corrosivity Categories equivalent to C4 and above.
- Years to first maintenance are dependant on the details of the coating systems (surface preparation, product selection, thickness etc). Contact your local VSL Technical Centre for further advice on specific applications.
- Category Cx is associated with very high salt deposition or severe acidic industrial environments. These conditions typically require bespoke three-coat paint protection system design.
- Inorganic Zinc information provided on the basis of a single coat application. Special precautions are required when used in conjunction with other topcoat systems.

5 VSL CT Stress Bar – stressing equipment

Recess dimensions (mm)

75	VSL460	485	510	220	100	4600	425

6 Handling and installation recommendations

- VSL CT Stress Bar MUST NOT be welded under any circumstances. All bars must be isolated and insulated against stray currents, electrical arcing, as well as localised heating, splashing with weld metal or grinding sparks. If welding is to take place in the vicinity of the bars, please ensure that the elements being welded are satisfactorily earthed as close as possible to the site of welding.
- Please consult a Welding Specialist if you are considering welding in the vicinity of the bars. During handling, care should be taken to avoid local damage or bending.
- The use of Roller Supports or similar makes the threading on of fittings easier and minimises potential bar and thread damage.
- The use of a lifting beam or multiple suspension points should be considered for the installation of long bar assemblies in order to minimise induced bending.
- If stored externally, the bars should be protected from the elements using temporary covers. It is recommended that bars and their components are stored systematically to facilitate traceability. The use of a soluble oil, such as Dromus, as a rust inhibitor coating is recommended for extended storage periods.
- All bar and component threads must be inspected and cleaned before assembly. Any superficial damage can be repaired by experienced personnel. Please contact your local VSL office for details.
- Light rusting is not harmful to the bars however deep pitting corrosion must be avoided.
- Bars MUST be engaged to the midpoint of all standard couplers.
- Vibration may cause nuts and fittings to loosen. Lock nuts are available to mitigate against possible loosening effects.
- Developing and measuring a nominated tensile load in a bar is best performed using a calibrated centre hole jack.
- Bars can be stressed via alternative applied torque methods. Evaluation of the actual applied tension is recommended.
- Small elongation of short bars under load, accurate determination of thread take up and limited accuracy in general field measurement, means that the reliance on elongation as a control in tensile force determination is limited.
- The proper installation, stressing and grouting of high tensile steel bars is critical for ensuring their long term performance. VSL recommends engaging experienced, trained personnel to manage this process to ensure performance, durability and OH&S requirements.
- When grouting, consideration needs to be exercised to allow and compensate for any grout bleed particularly for long, vertical bars.
- Consideration should be given to sealing of completed assemblies for corrosion protection.
